

Production - Best Android Camera Settings

[3. Production - Shooting Your Videos](#)

BEST SETTINGS ANDROID

Here we are, the best settings for Android. To keep it simple here is a list of the settings we recommend changing:

Note: This might be slightly different depending on what model of phone you have so we have done our best to tell you about the changes that will be on the most phones possible.

To access the camera settings click on the Camera App and select Camera Setting in the corner

Set Video size to 4k (or 3840 x 2160 if it doesn't say 4k. This is the exact pixel size of 4k.)

Set FPS to 30. FPS is the number of video frames that are taken every second.

Enable Stabilization

Grid Lines - Enable

This might not be the exact same on every single Android phone and you might have to do a little bit of Google searching if it looks slightly different.

Now when you go back to the camera view you will see grid lines to better set up your shot.
